Substitution and Composition

Definition

Given p a sentence and θ_1, θ_2 two substitutions, the **composition** of θ_1 and θ_2 is the substitution $\theta = \text{COMPOSE}(\theta_1, \theta_2)$ such that:

$$\text{SUBST}(\theta, p) = \text{SUBST}(\theta_1, \text{SUBST}(\theta_2, p)) = \text{SUBST}(\theta_2, \text{SUBST}(\theta_1, p))$$

Example

Sentence p is $P(y) \wedge Q(x) \Rightarrow R(z)$

Consider $\theta_1 = \{y/\text{Toto}, z/\text{Titi}\}$, $\theta_2 = \{x/\text{Tata}\}$

$\text{SUBST}(\theta_1, p) = P(\text{Toto}) \wedge Q(x) \Rightarrow R(\text{Titi})$

$\text{SUBST}(\theta_2, p) = P(y) \wedge Q(\text{Tata}) \Rightarrow R(z)$

$\text{SUBST}(\text{COMPOSE}(\theta_1, \theta_2), p) = P(\text{Toto}) \wedge Q(\text{Tata}) \Rightarrow R(\text{Titi})$

Backward chaining: main idea

Definition

Given a definite clause $p_1 \wedge \dots \wedge p_n \Rightarrow c$, c is called the **Head**.
 $p_1 \wedge \dots \wedge p_n$ is called the **Body**.

BC Idea

Goal-driven algorithm.

- 1 Unification of the goal with the head of a rule
- 2 Propagation of the substitution to the body. Every premise of the body is a new goal
- 3 Apply BC recursively on the new goals...

Based on a depth-first search (DFS).

Backward chaining: algorithm

```
function FOL-BC-Ask(KB, goals,  $\theta$ ) returns a set of substitutions
  inputs: KB, a knowledge base
           goals, a list of conjuncts forming a query ( $\theta$  already applied)
            $\theta$ , the current substitution, initially the empty substitution { }
  local variables: answers, a set of substitutions, initially empty

  if goals is empty then return { $\theta$ }
   $q' \leftarrow$  SUBST( $\theta$ , FIRST(goals))
  for each sentence r in KB
    where STANDARDIZE-APART(r) = ( $p_1 \wedge \dots \wedge p_n \Rightarrow q$ )
    and  $\theta' \leftarrow$  UNIFY(q,  $q'$ ) succeeds
     $new\_goals \leftarrow$  [ $p_1, \dots, p_n$  | REST(goals)]
     $answers \leftarrow$  FOL-BC-Ask(KB, new_goals, COMPOSE( $\theta'$ ,  $\theta$ ))  $\cup$  answers
  return answers
```

Backward chaining: DFS-tree

Example

{ x / Yannick }

GoodTeacher(Yannick)

Backward chaining: DFS-tree

Example

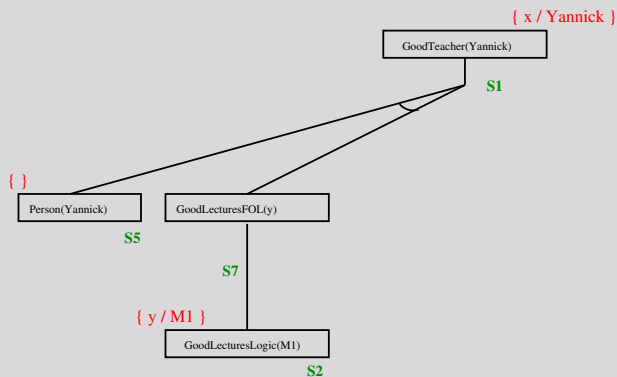

Backward chaining: DFS-tree

Example

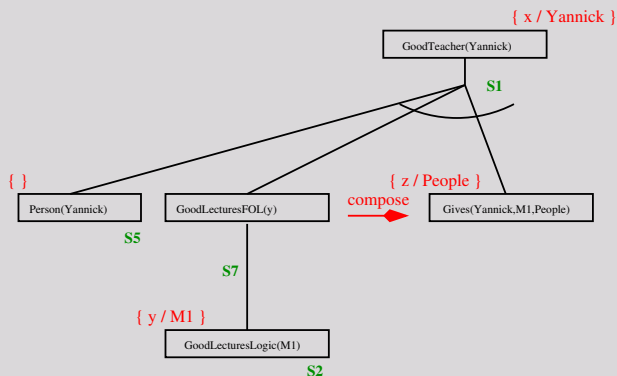

Backward chaining: DFS-tree

Example

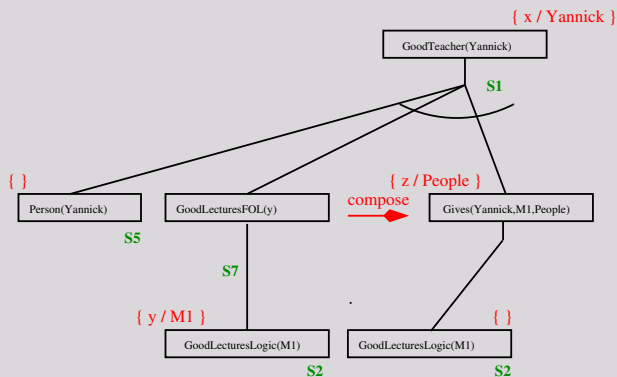

Backward chaining: DFS-tree

Example

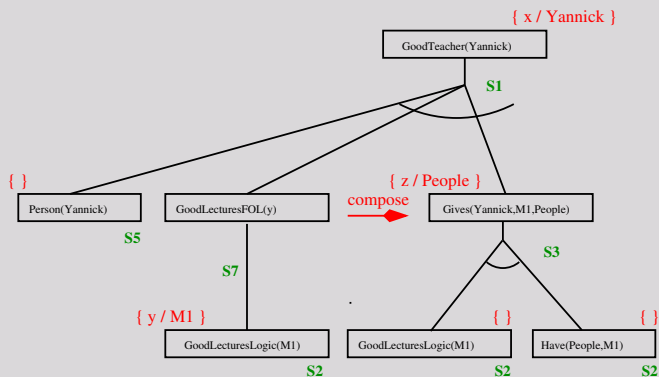

Backward chaining: DFS-tree

Example

Properties of BC

Depth-first recursive proof search: space is **linear** in size of the proof.

Incomplete due to infinite loops (DFS). To fix that, we have to check the current goal against every goal in the stack.

Inefficient due to repeated subgoals. To fix that we must use a cache of previous results (**memoization**)

So what? If BC is not so good, why do we talk about it? Well, it is widely used and with good optimisations it works! (linear algorithm): PROLOG

Outline

1 Backward chaining

2 Resolution

Example

Everyone who loves all animals is loved by someone. Anyone who kills an animal is loved by no one. Jack loves all animals. Either Jack or Curiosity killed the cat, who is named Tuna.

Did Curiosity kill the cat?

Another Knowledge base

Example

"Everyone who loves all animals is loved by someone."

Another Knowledge base

Example

"Everyone who loves all animals is loved by someone."

$\forall x [\forall y \text{ Animal}(y) \Rightarrow \text{Loves}(x, y)] \Rightarrow [\exists y \text{ Loves}(y, x)]$

Another Knowledge base

Example

"Everyone who loves all animals is loved by someone."

$$\forall x [\forall y \textit{Animal}(y) \Rightarrow \textit{Loves}(x, y)] \Rightarrow [\exists y \textit{Loves}(y, x)]$$

"Anyone who kills an animal is loved by no one.."

Another Knowledge base

Example

"Everyone who loves all animals is loved by someone."

$$\forall x [\forall y \textit{Animal}(y) \Rightarrow \textit{Loves}(x, y)] \Rightarrow [\exists y \textit{Loves}(y, x)]$$

"Anyone who kills an animal is loved by no one.."

$$\forall x [\exists y \textit{Animal}(y) \wedge \textit{Kills}(x, y)] \Rightarrow [\forall z \neg \textit{Loves}(z, x)]$$

Another Knowledge base

Example

"Everyone who loves all animals is loved by someone."

$$\forall x [\forall y \textit{Animal}(y) \Rightarrow \textit{Loves}(x, y)] \Rightarrow [\exists y \textit{Loves}(y, x)]$$

"Anyone who kills an animal is loved by no one.."

$$\forall x [\exists y \textit{Animal}(y) \wedge \textit{Kills}(x, y)] \Rightarrow [\forall z \neg \textit{Loves}(z, x)]$$

"Jack loves all animals"

Another Knowledge base

Example

"Everyone who loves all animals is loved by someone."

$$\forall x [\forall y \textit{Animal}(y) \Rightarrow \textit{Loves}(x, y)] \Rightarrow [\exists y \textit{Loves}(y, x)]$$

"Anyone who kills an animal is loved by no one.."

$$\forall x [\exists y \textit{Animal}(y) \wedge \textit{Kills}(x, y)] \Rightarrow [\forall z \neg \textit{Loves}(z, x)]$$

"Jack loves all animals"

$$\forall x \textit{Animal}(x) \Rightarrow \textit{Loves}(\textit{Jack}, x)$$

Another Knowledge base

Example

"Everyone who loves all animals is loved by someone."

$$\forall x [\forall y \textit{Animal}(y) \Rightarrow \textit{Loves}(x, y)] \Rightarrow [\exists y \textit{Loves}(y, x)]$$

"Anyone who kills an animal is loved by no one.."

$$\forall x [\exists y \textit{Animal}(y) \wedge \textit{Kills}(x, y)] \Rightarrow [\forall z \neg \textit{Loves}(z, x)]$$

"Jack loves all animals"

$$\forall x \textit{Animal}(x) \Rightarrow \textit{Loves}(\textit{Jack}, x)$$

"Either Jack or Curiosity killed the cat, who is named Tuna"

Another Knowledge base

Example

"Everyone who loves all animals is loved by someone."

$$\forall x [\forall y \textit{Animal}(y) \Rightarrow \textit{Loves}(x, y)] \Rightarrow [\exists y \textit{Loves}(y, x)]$$

"Anyone who kills an animal is loved by no one.."

$$\forall x [\exists y \textit{Animal}(y) \wedge \textit{Kills}(x, y)] \Rightarrow [\forall z \neg \textit{Loves}(z, x)]$$

"Jack loves all animals"

$$\forall x \textit{Animal}(x) \Rightarrow \textit{Loves}(\textit{Jack}, x)$$

"Either Jack or Curiosity killed the cat, who is named Tuna"

$$\textit{Kills}(\textit{Jack}, \textit{Tuna}) \vee \textit{Kills}(\textit{Curiosity}, \textit{Tuna})$$

Another Knowledge base

Example

"Everyone who loves all animals is loved by someone."

$$\forall x [\forall y \textit{Animal}(y) \Rightarrow \textit{Loves}(x, y)] \Rightarrow [\exists y \textit{Loves}(y, x)]$$

"Anyone who kills an animal is loved by no one.."

$$\forall x [\exists y \textit{Animal}(y) \wedge \textit{Kills}(x, y)] \Rightarrow [\forall z \neg \textit{Loves}(z, x)]$$

"Jack loves all animals"

$$\forall x \textit{Animal}(x) \Rightarrow \textit{Loves}(\textit{Jack}, x)$$

"Either Jack or Curiosity killed the cat, who is named Tuna"

$$\textit{Kills}(\textit{Jack}, \textit{Tuna}) \vee \textit{Kills}(\textit{Curiosity}, \textit{Tuna})$$

Tuna is a cat

Another Knowledge base

Example

"Everyone who loves all animals is loved by someone."

$$\forall x [\forall y \textit{Animal}(y) \Rightarrow \textit{Loves}(x, y)] \Rightarrow [\exists y \textit{Loves}(y, x)]$$

"Anyone who kills an animal is loved by no one.."

$$\forall x [\exists y \textit{Animal}(y) \wedge \textit{Kills}(x, y)] \Rightarrow [\forall z \neg \textit{Loves}(z, x)]$$

"Jack loves all animals"

$$\forall x \textit{Animal}(x) \Rightarrow \textit{Loves}(\textit{Jack}, x)$$

"Either Jack or Curiosity killed the cat, who is named Tuna"

$$\textit{Kills}(\textit{Jack}, \textit{Tuna}) \vee \textit{Kills}(\textit{Curiosity}, \textit{Tuna})$$

Tuna is a cat

$$\textit{Cat}(\textit{Tuna})$$

Another Knowledge base

Example

"Everyone who loves all animals is loved by someone."

$$\forall x [\forall y \textit{Animal}(y) \Rightarrow \textit{Loves}(x, y)] \Rightarrow [\exists y \textit{Loves}(y, x)]$$

"Anyone who kills an animal is loved by no one.."

$$\forall x [\exists y \textit{Animal}(y) \wedge \textit{Kills}(x, y)] \Rightarrow [\forall z \neg \textit{Loves}(z, x)]$$

"Jack loves all animals"

$$\forall x \textit{Animal}(x) \Rightarrow \textit{Loves}(\textit{Jack}, x)$$

"Either Jack or Curiosity killed the cat, who is named Tuna"

$$\textit{Kills}(\textit{Jack}, \textit{Tuna}) \vee \textit{Kills}(\textit{Curiosity}, \textit{Tuna})$$

Tuna is a cat

$$\textit{Cat}(\textit{Tuna})$$

A cat is an animal

Another Knowledge base

Example

"Everyone who loves all animals is loved by someone."

$$\forall x [\forall y \textit{Animal}(y) \Rightarrow \textit{Loves}(x, y)] \Rightarrow [\exists y \textit{Loves}(y, x)]$$

"Anyone who kills an animal is loved by no one.."

$$\forall x [\exists y \textit{Animal}(y) \wedge \textit{Kills}(x, y)] \Rightarrow [\forall z \neg \textit{Loves}(z, x)]$$

"Jack loves all animals"

$$\forall x \textit{Animal}(x) \Rightarrow \textit{Loves}(\textit{Jack}, x)$$

"Either Jack or Curiosity killed the cat, who is named Tuna"

$$\textit{Kills}(\textit{Jack}, \textit{Tuna}) \vee \textit{Kills}(\textit{Curiosity}, \textit{Tuna})$$

Tuna is a cat

$$\textit{Cat}(\textit{Tuna})$$

A cat is an animal

$$\forall x \textit{Cat}(x) \Rightarrow \textit{Animal}(x)$$

Another Knowledge base

Example

"Everyone who loves all animals is loved by someone."

$$\forall x [\forall y \textit{Animal}(y) \Rightarrow \textit{Loves}(x, y)] \Rightarrow [\exists y \textit{Loves}(y, x)]$$

"Anyone who kills an animal is loved by no one.."

$$\forall x [\exists y \textit{Animal}(y) \wedge \textit{Kills}(x, y)] \Rightarrow [\forall z \neg \textit{Loves}(z, x)]$$

"Jack loves all animals"

$$\forall x \textit{Animal}(x) \Rightarrow \textit{Loves}(\textit{Jack}, x)$$

"Either Jack or Curiosity killed the cat, who is named Tuna"

$$\textit{Kills}(\textit{Jack}, \textit{Tuna}) \vee \textit{Kills}(\textit{Curiosity}, \textit{Tuna})$$

Tuna is a cat

$$\textit{Cat}(\textit{Tuna})$$

A cat is an animal

$$\forall x \textit{Cat}(x) \Rightarrow \textit{Animal}(x)$$

Question: Did Curiosity kill the cat?

Another Knowledge base

Example

"Everyone who loves all animals is loved by someone."

$$\forall x [\forall y \text{ Animal}(y) \Rightarrow \text{Loves}(x, y)] \Rightarrow [\exists y \text{ Loves}(y, x)]$$

"Anyone who kills an animal is loved by no one.."

$$\forall x [\exists y \text{ Animal}(y) \wedge \text{Kills}(x, y)] \Rightarrow [\forall z \neg \text{Loves}(z, x)]$$

"Jack loves all animals"

$$\forall x \text{ Animal}(x) \Rightarrow \text{Loves}(\text{Jack}, x)$$

"Either Jack or Curiosity killed the cat, who is named Tuna"

$$\text{Kills}(\text{Jack}, \text{Tuna}) \vee \text{Kills}(\text{Curiosity}, \text{Tuna})$$

Tuna is a cat

$$\text{Cat}(\text{Tuna})$$

A cat is an animal

$$\forall x \text{ Cat}(x) \Rightarrow \text{Animal}(x)$$

Question: Did Curiosity kill the cat?

$$\text{Kills}(\text{Curiosity}, \text{Tuna})$$

Conjunctive Normal Form for FOL

Conjunctive Normal Form

A sentence in a **Conjunctive Normal Form** is a conjunction of clauses, each clause is a disjunction of literals.

Property

Every sentence in FOL (without equality) is logically equivalent to a FOL-CNF sentence.

Example

“Everyone who loves all animals is loved by someone”

$\forall x [\forall y \text{ Animal}(y) \Rightarrow \text{Loves}(x, y)] \Rightarrow [\exists y \text{ Loves}(y, x)]$

has the following CNF

$[\text{Animal}(F(x)) \vee \text{Loves}(G(x), x)] \wedge [\neg \text{Loves}(x, F(x)) \vee \text{Loves}(G(x), x)].$

Conversion to CNF

Method

- 1 Elimination of implications
 - $A \Rightarrow B \equiv \neg A \vee B$
- 2 Move \neg inwards
- 3 Standardize variables
- 4 Skolemisation
- 5 Drop the universal quantifiers
- 6 Distribute \vee over \wedge

Move \neg inwards and variable standardization

Rules for negated quantifiers

$$\neg \forall x p \equiv \exists x \neg p$$

$$\neg \exists x p \equiv \forall x \neg p$$

Variable standardization

$$(\forall x P(x)) \vee (\exists x Q(x))$$

x is used twice but it does not represent the same thing (two different scopes). To avoid confusion, we rename:

$$(\forall x P(x)) \vee (\exists y Q(y))$$

Skolemization

Definition

Skolemisation is the process of removing existential quantifiers by elimination.

- Simple case = Existential Instantiation
- Complex case = Use of **Skolem functions**

Example

Simple case: $\exists x P(x)$

Using EI, we have: $P(A)$

Complex case: $\forall x [\exists y P(x, y)]$

Using EI, we have: $\forall x P(x, A)$ **wrong**

Use of a Skolem function $F(x)$: $\forall x P(x, F(x))$

(y in is the scope of x)

Conversion to CNF: example

Example

$\forall x [\forall y \textit{Animal}(y) \Rightarrow \textit{Loves}(x, y)] \Rightarrow [\exists y \textit{Loves}(y, x)]$

Conversion to CNF: example

Example

$\forall x [\forall y \text{ Animal}(y) \Rightarrow \text{Loves}(x, y)] \Rightarrow [\exists y \text{ Loves}(y, x)]$

- 1 Eliminate implications:

$\forall x [\neg \forall y \neg \text{Animal}(y) \vee \text{Loves}(x, y)] \vee [\exists y \text{ Loves}(y, x)]$

Conversion to CNF: example

Example

$\forall x [\forall y \text{ Animal}(y) \Rightarrow \text{Loves}(x, y)] \Rightarrow [\exists y \text{ Loves}(y, x)]$

- 1 Eliminate implications:

$\forall x [\neg \forall y \neg \text{Animal}(y) \vee \text{Loves}(x, y)] \vee [\exists y \text{ Loves}(y, x)]$

- 2 Move \neg inwards

$\bullet \forall x [\exists y \neg(\neg \text{Animal}(y) \vee \text{Loves}(x, y))] \vee [\exists y \text{ Loves}(y, x)]$

Conversion to CNF: example

Example

$\forall x [\forall y \text{ Animal}(y) \Rightarrow \text{Loves}(x, y)] \Rightarrow [\exists y \text{ Loves}(y, x)]$

- 1 Eliminate implications:

$\forall x [\neg \forall y \neg \text{Animal}(y) \vee \text{Loves}(x, y)] \vee [\exists y \text{ Loves}(y, x)]$

- 2 Move \neg inwards

- $\forall x [\exists y \neg(\neg \text{Animal}(y) \vee \text{Loves}(x, y))] \vee [\exists y \text{ Loves}(y, x)]$
- $\forall x [\exists y \neg \neg \text{Animal}(y) \wedge \neg \text{Loves}(x, y)] \vee [\exists y \text{ Loves}(y, x)]$ (De Morgan)

Conversion to CNF: example

Example

$\forall x [\forall y \text{ Animal}(y) \Rightarrow \text{Loves}(x, y)] \Rightarrow [\exists y \text{ Loves}(y, x)]$

- 1 Eliminate implications:

$\forall x [\neg \forall y \neg \text{Animal}(y) \vee \text{Loves}(x, y)] \vee [\exists y \text{ Loves}(y, x)]$

- 2 Move \neg inwards

- $\forall x [\exists y \neg(\neg \text{Animal}(y) \vee \text{Loves}(x, y))] \vee [\exists y \text{ Loves}(y, x)]$
- $\forall x [\exists y \neg \neg \text{Animal}(y) \wedge \neg \text{Loves}(x, y)] \vee [\exists y \text{ Loves}(y, x)]$ (De Morgan)
- $\forall x [\exists y \text{ Animal}(y) \wedge \neg \text{Loves}(x, y)] \vee [\exists y \text{ Loves}(y, x)]$ (double negation)

Conversion to CNF: example

Example

$\forall x [\forall y \text{ Animal}(y) \Rightarrow \text{Loves}(x, y)] \Rightarrow [\exists y \text{ Loves}(y, x)]$

- 1 Eliminate implications:

$\forall x [\neg \forall y \neg \text{Animal}(y) \vee \text{Loves}(x, y)] \vee [\exists y \text{ Loves}(y, x)]$

- 2 Move \neg inwards

- $\forall x [\exists y \neg(\neg \text{Animal}(y) \vee \text{Loves}(x, y))] \vee [\exists y \text{ Loves}(y, x)]$
- $\forall x [\exists y \neg \neg \text{Animal}(y) \wedge \neg \text{Loves}(x, y)] \vee [\exists y \text{ Loves}(y, x)]$ (De Morgan)
- $\forall x [\exists y \text{ Animal}(y) \wedge \neg \text{Loves}(x, y)] \vee [\exists y \text{ Loves}(y, x)]$
(double negation)

- 3 Standardize variables:

$\forall x [\exists y \text{ Animal}(y) \wedge \neg \text{Loves}(x, y)] \vee [\exists z \text{ Loves}(z, x)]$

Conversion to CNF: example

Example

$\forall x [\forall y \text{ Animal}(y) \Rightarrow \text{Loves}(x, y)] \Rightarrow [\exists y \text{ Loves}(y, x)]$

- 1 Eliminate implications:

$\forall x [\neg \forall y \neg \text{Animal}(y) \vee \text{Loves}(x, y)] \vee [\exists y \text{ Loves}(y, x)]$

- 2 Move \neg inwards

- $\forall x [\exists y \neg(\neg \text{Animal}(y) \vee \text{Loves}(x, y))] \vee [\exists y \text{ Loves}(y, x)]$
- $\forall x [\exists y \neg \neg \text{Animal}(y) \wedge \neg \text{Loves}(x, y)] \vee [\exists y \text{ Loves}(y, x)]$ (De Morgan)
- $\forall x [\exists y \text{ Animal}(y) \wedge \neg \text{Loves}(x, y)] \vee [\exists y \text{ Loves}(y, x)]$
(double negation)

- 3 Standardize variables:

$\forall x [\exists y \text{ Animal}(y) \wedge \neg \text{Loves}(x, y)] \vee [\exists z \text{ Loves}(z, x)]$

- 4 Skolemization: $\forall x [\text{Animal}(F(x)) \wedge \neg \text{Loves}(x, F(x))] \vee [\text{Loves}(G(x), x)]$

Conversion to CNF: example

Example

$\forall x [\forall y \text{ Animal}(y) \Rightarrow \text{Loves}(x, y)] \Rightarrow [\exists y \text{ Loves}(y, x)]$

- 1 Eliminate implications:

$\forall x [\neg \forall y \neg \text{Animal}(y) \vee \text{Loves}(x, y)] \vee [\exists y \text{ Loves}(y, x)]$

- 2 Move \neg inwards

- $\forall x [\exists y \neg(\neg \text{Animal}(y) \vee \text{Loves}(x, y))] \vee [\exists y \text{ Loves}(y, x)]$
- $\forall x [\exists y \neg \neg \text{Animal}(y) \wedge \neg \text{Loves}(x, y)] \vee [\exists y \text{ Loves}(y, x)]$ (De Morgan)
- $\forall x [\exists y \text{ Animal}(y) \wedge \neg \text{Loves}(x, y)] \vee [\exists y \text{ Loves}(y, x)]$ (double negation)

- 3 Standardize variables:

$\forall x [\exists y \text{ Animal}(y) \wedge \neg \text{Loves}(x, y)] \vee [\exists z \text{ Loves}(z, x)]$

- 4 Skolemization: $\forall x [\text{Animal}(F(x)) \wedge \neg \text{Loves}(x, F(x))] \vee [\text{Loves}(G(x), x)]$

- 5 Drop universal quantifiers:

$[\text{Animal}(F(x)) \wedge \neg \text{Loves}(x, F(x))] \vee [\text{Loves}(G(x), x)]$

Conversion to CNF: example

Example

$\forall x [\forall y \text{ Animal}(y) \Rightarrow \text{Loves}(x, y)] \Rightarrow [\exists y \text{ Loves}(y, x)]$

- 1 Eliminate implications:

$\forall x [\neg \forall y \neg \text{Animal}(y) \vee \text{Loves}(x, y)] \vee [\exists y \text{ Loves}(y, x)]$

- 2 Move \neg inwards

- $\forall x [\exists y \neg(\neg \text{Animal}(y) \vee \text{Loves}(x, y))] \vee [\exists y \text{ Loves}(y, x)]$
- $\forall x [\exists y \neg \neg \text{Animal}(y) \wedge \neg \text{Loves}(x, y)] \vee [\exists y \text{ Loves}(y, x)]$ (De Morgan)
- $\forall x [\exists y \text{ Animal}(y) \wedge \neg \text{Loves}(x, y)] \vee [\exists y \text{ Loves}(y, x)]$
(double negation)

- 3 Standardize variables:

$\forall x [\exists y \text{ Animal}(y) \wedge \neg \text{Loves}(x, y)] \vee [\exists z \text{ Loves}(z, x)]$

- 4 Skolemization: $\forall x [\text{Animal}(F(x)) \wedge \neg \text{Loves}(x, F(x))] \vee [\text{Loves}(G(x), x)]$

- 5 Drop universal quantifiers:

$[\text{Animal}(F(x)) \wedge \neg \text{Loves}(x, F(x))] \vee [\text{Loves}(G(x), x)]$

- 6 Distribute \vee over \wedge :

$[\text{Animal}(F(x)) \vee \text{Loves}(G(x), x)] \wedge [\neg \text{Loves}(x, F(x)) \vee \text{Loves}(G(x), x)]$

Resolution: inference rule

Rule

$$\frac{\ell_1 \vee \dots \vee \boxed{\ell_i} \vee \dots \vee \ell_k, \quad \ell'_1 \vee \dots \vee \boxed{\ell'_j} \vee \dots \vee \ell'_n}{\text{SUBST}(\theta, \ell_1 \vee \dots \vee \ell_{i-1} \vee \ell_{i+1} \vee \dots \vee \ell_k \vee \ell'_1 \vee \dots \vee \ell'_{j-1} \vee \ell'_{j+1} \vee \dots \vee \ell'_n)}$$

with θ a substitution such that $\text{UNIFY}(\boxed{\ell_i}, \neg \boxed{\ell'_j}) = \theta$

Example

$$\underline{[\text{Animal}(F(x)) \vee \text{Loves}(G(x), x)] \quad [\neg \text{Loves}(u, v) \vee \neg \text{Kills}(u, v)]}$$

Resolution: inference rule

Rule

$$\frac{\ell_1 \vee \dots \vee \boxed{\ell_i} \vee \dots \vee \ell_k, \quad \ell'_1 \vee \dots \vee \boxed{\ell'_j} \vee \dots \vee \ell'_n}{\text{SUBST}(\theta, \ell_1 \vee \dots \vee \ell_{i-1} \vee \ell_{i+1} \vee \dots \vee \ell_k \vee \ell'_1 \vee \dots \vee \ell'_{j-1} \vee \ell'_{j+1} \vee \dots \vee \ell'_n)}$$

with θ a substitution such that $\text{UNIFY}(\boxed{\ell_i}, \neg \boxed{\ell'_j}) = \theta$

Example

$$\frac{[\text{Animal}(F(x)) \vee \boxed{\text{Loves}(G(x), x)}]}{[\boxed{\neg \text{Loves}(u, v)} \vee \neg \text{Kills}(u, v)]}$$

Resolution: inference rule

Rule

$$\frac{\ell_1 \vee \dots \vee \boxed{\ell_i} \vee \dots \vee \ell_k, \quad \ell'_1 \vee \dots \vee \boxed{\ell'_j} \vee \dots \vee \ell'_n}{\text{SUBST}(\theta, \ell_1 \vee \dots \vee \ell_{i-1} \vee \ell_{i+1} \vee \dots \vee \ell_k \vee \ell'_1 \vee \dots \vee \ell'_{j-1} \vee \ell'_{j+1} \vee \dots \vee \ell'_n)}$$

with θ a substitution such that $\text{UNIFY}(\boxed{\ell_i}, \neg \boxed{\ell'_j}) = \theta$

Example

$$\frac{[\text{Animal}(F(x)) \vee \boxed{\text{Loves}(G(x), x)}] \quad [\boxed{\neg \text{Loves}(u, v)} \vee \neg \text{Kills}(u, v)]}{\text{SUBST}(\theta, \text{Animal}(F(x)) \vee \neg \text{Kills}(u, v))}$$

Resolution: inference rule

Rule

$$\frac{\ell_1 \vee \dots \vee \boxed{\ell_i} \vee \dots \vee \ell_k, \quad \ell'_1 \vee \dots \vee \boxed{\ell'_j} \vee \dots \vee \ell'_n}{\text{SUBST}(\theta, \ell_1 \vee \dots \vee \ell_{i-1} \vee \ell_{i+1} \vee \dots \vee \ell_k \vee \ell'_1 \vee \dots \vee \ell'_{j-1} \vee \ell'_{j+1} \vee \dots \vee \ell'_n)}$$

with θ a substitution such that $\text{UNIFY}(\boxed{\ell_i}, \neg \boxed{\ell'_j}) = \theta$

Example

$$\frac{[\text{Animal}(F(x)) \vee \boxed{\text{Loves}(G(x), x)}] \quad [\boxed{\neg \text{Loves}(u, v)} \vee \neg \text{Kills}(u, v)]}{\text{SUBST}(\theta, \text{Animal}(F(x)) \vee \neg \text{Kills}(u, v))}$$

$$\theta = \{u/G(x), v/x\}$$

Resolution: inference rule

Rule

$$\frac{\ell_1 \vee \dots \vee \boxed{\ell_i} \vee \dots \vee \ell_k, \quad \ell'_1 \vee \dots \vee \boxed{\ell'_j} \vee \dots \vee \ell'_n}{\text{SUBST}(\theta, \ell_1 \vee \dots \vee \ell_{i-1} \vee \ell_{i+1} \vee \dots \vee \ell_k \vee \ell'_1 \vee \dots \vee \ell'_{j-1} \vee \ell'_{j+1} \vee \dots \vee \ell'_n)}$$

with θ a substitution such that $\text{UNIFY}(\boxed{\ell_i}, \neg \boxed{\ell'_j}) = \theta$

Example

$$\frac{[\text{Animal}(F(x)) \vee \boxed{\text{Loves}(G(x), x)}] \quad [\boxed{\neg \text{Loves}(u, v)} \vee \neg \text{Kills}(u, v)]}{\text{Animal}(F(x)) \vee \neg \text{Kills}(G(x), x)}$$

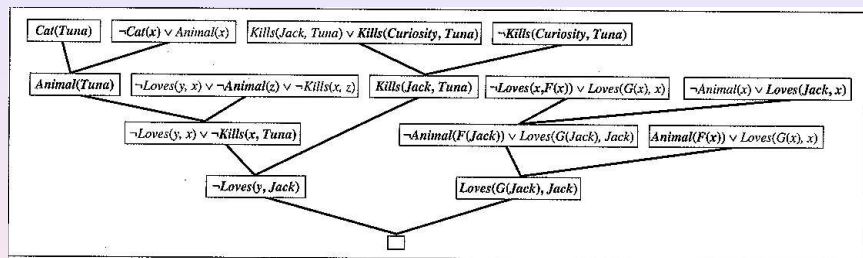

$$\theta = \{u/G(x), v/x\}$$

Resolution algorithm

Definition

Proof by contradiction: given KB , to prove α , we prove that $KB \wedge \neg\alpha$ is not satisfiable.

Resolution: example

Resolution Proof that Curiosity has killed the cat:

- $\neg\alpha$ is $\neg Kills(Curiosity, Tuna)$
- Use of the factoring rule to infer $Loves(G(Jack), Jack)$

Dealing with equality

Paramodulation

There are several ways to deal with $t_1 = t_2$. One of them is **Paramodulation**:

$$\frac{l_1 \vee \dots \vee l_k \vee t_1 = t_2, \quad l'_1 \vee \dots \vee l'_n[t_3]}{\text{SUBST}(\theta, l_1 \vee \dots \vee l'_n[y])}$$

where

$$\text{UNIFY}(t_1, t_3) = \theta$$

This inference rule can be used during the resolution algorithm.

Example

$$\frac{\text{Father}(\text{John}) = \text{Father}(\text{Richard}) \quad \text{Male}(\text{Father}(x))}{\text{Male}(\text{Father}(\text{Richard}))}$$

$$\theta = \{x/\text{John}\} = \text{UNIFY}(\text{Father}(\text{John}), \text{Father}(x))$$

Theorem provers

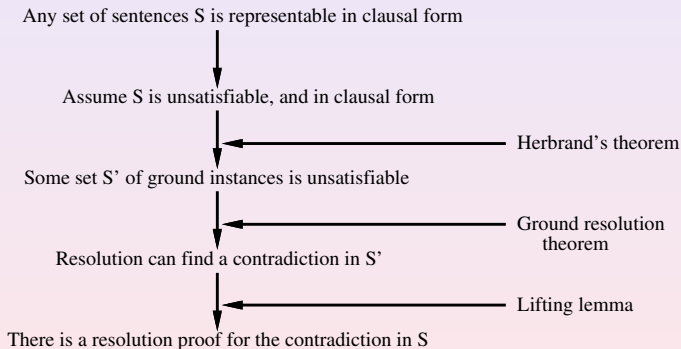

Unlike logic programming language, **Theorem provers** cover FOL (no restriction on Definite Clauses). Their algorithm is based on resolution.
Theorem prover: OTTER

Optimisations

Using the resolution algorithm in a “clever” way.

- **Unit preference:** Inference of sentences with a minimal number of literals (more chance to get the empty clause)
- **Set of support:** What is the set of clauses in KB that will be *useful*?
- **Input resolution:** Always using a sentence from KB or α to apply the resolution rule.
- **Subsumption:** Elimination of sentences that are subsumed by (more specific than) an existing sentence in the KB.

Completeness of resolution

Inference in FOL

- **Propositionalisation**: very slow
- **Unification** techniques: much more efficient
- Generalised Modus Ponens: FC and BC on Definite clauses
 - FC for **deductive databases**
 - BC for **logic programming**
- Entailment problem is semi-decidable
- Generalised **resolution**: complete proof system (CNF)

To Infinity and Beyond!

A dream

Using theorem proving to automatically prove everything...

A first step

To prove everything, we need to prove everything in arithmetic...

Arithmetic

Logic for arithmetic: 0 , $S(\cdot)$, \times , $+$, *Expt* (extension of FOL, more expressive)

Gödel's incompleteness theorem

Gödel said (after a proof on 30 pages):

“Whatever your logic is, if your logic can express arithmetic, whatever your KB is, I can exhibit a sentence in your logic such that the sentence is entailed by KB but there's no way to prove it by inference thanks to your KB”

The reality

Sorry for the inconvenience...
